

Day 27

Exploitation Analyst

Linux Security:

Some basic tips and tricks:

1. nano logrotate.conf

- Opens the file logrotate.conf in the nano text editor.
- Standard usage.
- No cursor position is shown by default.

2. nano -c logrotate.conf

- Opens the same file but with the -c flag.
- -c stands for "constant cursor position display."
- It shows the line and column number of the cursor at all times in the status bar (at the bottom).

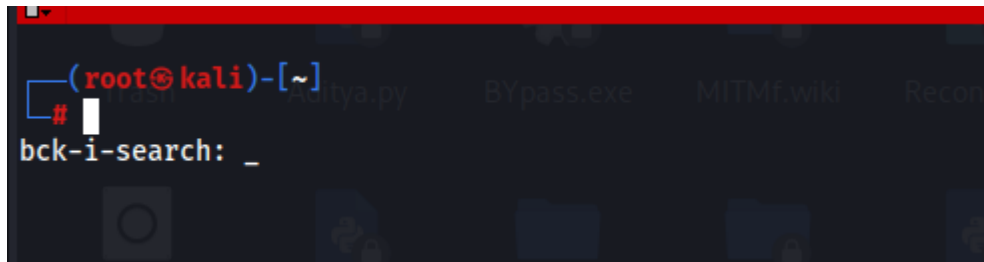

3. mc

The mc command refers to Midnight Commander, a text-based file manager for Unix-like systems. It gives you a powerful, dual-pane interface in the terminal to manage files easily — sort of like a graphical file explorer, but in text mode.

4. Ctrl + R

Start typing part of a previous command, e.g., ssh, and it will auto-fill the most recent matching command:

A terminal window with a dark background and a red title bar. The prompt is `(root@kali)-[~]` with a red `#` character. Below the prompt, the text `bck-i-search: _` is displayed, indicating a search for a previous command starting with an underscore. The background of the terminal shows faint, semi-transparent icons of files and folders, including `itya.py`, `Bypass.exe`, `MITMf.wiki`, and `Recon`.
